

SERIES 7

TRACKLESS VEHICLES DUMP BODY

The Dump Body is an option for municipalities that wish to double the spread distance with the Rear Sidewalk Spreader before having to return for a refill. The operator spreads material until empty and then refills the rear spreader by hydraulically raising the dump body. The built-in tailgate opens and closes automatically as the dump body is raised and lowered. When the winter season is over, the dump body and its supporting frame can be unbolted and stored until the following winter.

Capacity: $\frac{3}{4}$ cubic yard

Lift angle: 42°

Hydraulic cylinders: 2 - 14" x 2"

General Info

Side panel construction: Corrugated profile for additional strength

Tailgate: Automatic open/close when body raised or lowered

Off-season storage: If required, the complete unit is removable and replacement hoods are available
